## Technical Data Sheet

### ADISLIP L

Adislip L is a mixture of inorganic and organic compounds used to prevent entanglement and knotting of leather hides and skins in the drum.

#### **Description**

Adislip L is a fine off-white powder of approximately 97% concentration based on dry weight.

#### **Properties**

May be used in most wet processes in the drum to prevent rubbing abrasion, and tear marks on hides and skins, and to ensure even distribution of product additions used in the leather processes. As knots, ties and entanglements are prevented, lower floats may often be used which gives better penetration of utilized auxiliaries. Often higher loading capacities may result from the use of Adislip L, and energy savings are possible as the drum runs in a smoother and more uniform manner. The components in Adislip L do not react with the leather fibers.

#### **Application**

Normally 0.25-0.5 % on the shaved weight is used for most applications such as neutralizing, retanning, fatliquoring and dyeing. Slightly higher amounts may be used during tanning operations. The Adislip L should be added undiluted to the drum, and may be easily washed off with water as required.
